Linear: A Modern Product Development Tool

Linear is a modern project management and issue-tracking platform designed primarily for software development and product teams. It provides a centralized workspace where teams can plan, organize, prioritize, track, and manage their work throughout the software development lifecycle. It provides features such as projects, cycles, roadmaps, initiatives, and team management to help organizations manage both short-term development tasks and long-term product goals

Why Linear?

The Problem

Challenges with traditional project management

Complicated workflows

Multiple processes and tools make managing projects complex and confusing.

Too many clicks

Simple actions often require multiple steps, wasting time and reducing productivity.

Information scattered across tools

Tasks, discussions, documents, and development updates are spread across different platforms.

Difficult to connect planning with development

High-level plans and day-to-day development work are often disconnected, leading to delays and lack of visibility.

The Linear Way

A faster, simpler, and more connected way to build

Fast workflow

Streamlined workflows allow teams to create, assign, and track work quickly.

Clean interface

A simple and organized interface reduces distractions and makes information easier to access.

Developer-focused

Built for software teams with features like Git integrations, automation, and keyboard shortcuts.

Planning + development in one place

Connects roadmaps, projects, cycles, and issues so teams can move from high-level planning to day-to-day development seamlessly.

Linear's Key Functionalities

ISSUES

PROJECTS

Group related Issues and manage larger Project goals.

CYCLES

Break work into short iterations and focused development.

ROADMAPS

Visualize upcoming features,milestones and product plans.

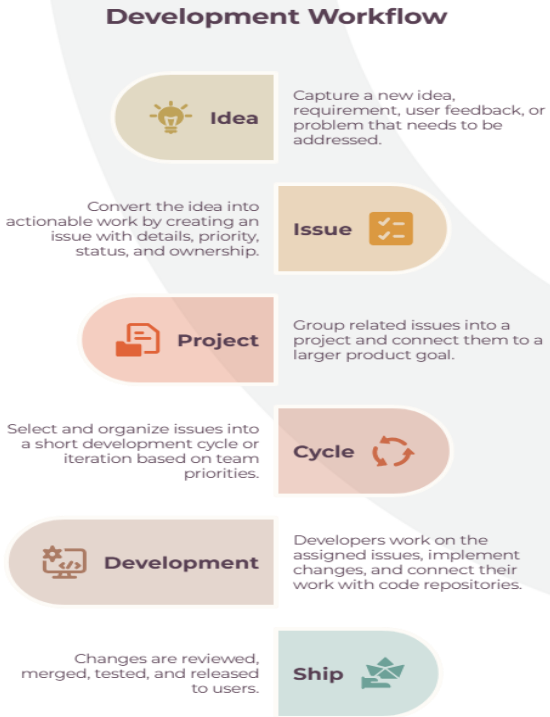

TEAMS

Organize members and manage work across different teams.

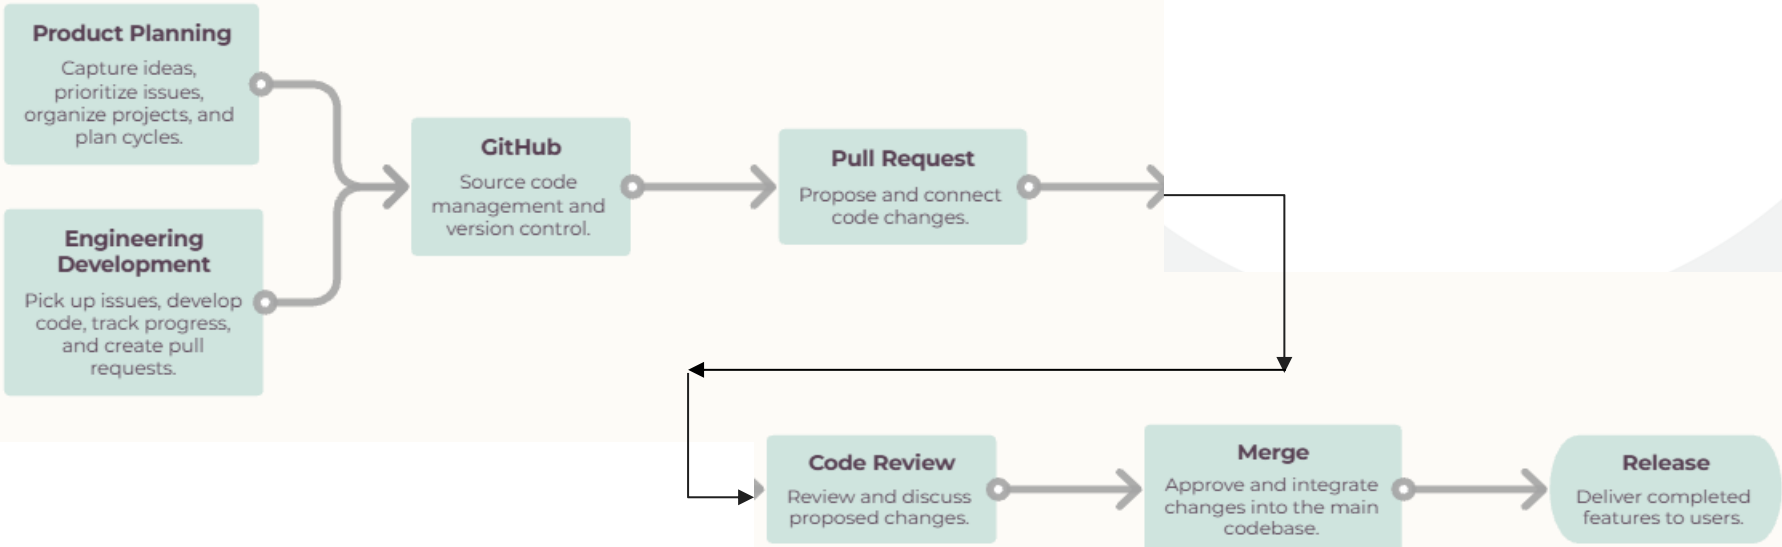

INTEGRATIONS

Connect Linear wih development and collaboration tools such as Github,slack and Gitlab
